Please clarify. *Response: The storm sewer specification on C-08 indicates that SDR-35 can be used for 12" and below. It also indicates that HDPE can be used for 36" can below. Either specified product is acceptable for 12" and below storm sewer piping.*
7. Question: On the 2" waterline for this project there is a proposed water meter vault. B. Testing Agency: General Contractor will engage a qualified geotechnical engineering testing agency to perform tests and inspections.

C. Allow testing agency to inspect and test subgrades and each fill or backfill layer. Proceed with subsequent earth moving only after test results for previously completed work comply with requirements.

D. Footing Subgrade: At footing subgrades, at least one test of each soil stratum will be performed to verify design bearing capacities. Subsequent verification and approval of other footing subgrades may be based on a visual comparison of subgrade with tested subgrade when approved by Architect.

E. Testing agency will test compaction of soils in place according to ASTM D1556, ASTM D2167, ASTM D2937, and ASTM D6938, as applicable. Tests will be performed at the following locations and frequencies:

1. Paved and Building Slab Areas: At subgrade and at each compacted fill and backfill layer, at least one test for every 2000 sq. ft. or less of paved area or building slab but in no case fewer than three tests.
2. Foundation Wall Backfill: At each compacted backfill layer, at least one test for every 100 feet or less of wall length but no fewer than two tests.
3. Trench Backfill: At each compacted initial and final backfill layer, at least one test for every 150 feet or less of trench length but no fewer than two tests.

F. When testing agency reports that subgrades, fills, or backfills have not achieved degree of compaction specified, scarify and moisten or aerate, or remove and replace soil materials to depth required; recompact and retest until specified compaction is obtained.

3.17 PROTECTION

A. Protecting Graded Areas: Protect newly graded areas from traffic, freezing, and erosion. Keep free of trash and debris.

B. Repair and reestablish grades to specified tolerances where completed or partially completed surfaces become eroded, rutted, settled, or where they lose compaction due to subsequent construction operations or weather conditions.

1. Scarify or remove and replace soil material to depth as directed by Architect; reshape and recompact.

C. Where settling occurs before Project correction period elapses, remove finished surfacing, backfill with additional soil material, compact, and reconstruct surfacing.

1. Restore appearance, quality, and condition of finished surfacing to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.18 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Remove surplus satisfactory soil and waste materials, including unsatisfactory soil, trash, and debris, and legally dispose of them off Owner's property.

B. Transport surplus satisfactory soil to designated storage areas on Owner's property. Stockpile or spread soil as directed by Architect.

1. Remove waste materials, including unsatisfactory soil, trash, and debris, and legally dispose of them off Owner's property.

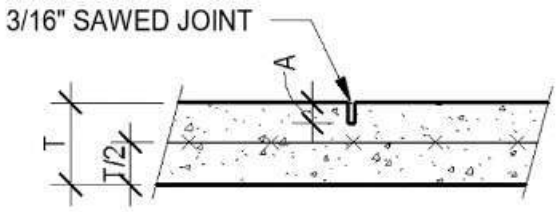
EXHIBIT A- SPLASH PAD CONCRETE SPECIFICATION INFORMATION

ADDENDUM TWO

This information is for the amorphous shaped splash pad concrete area.

1. Concrete Strength: 3,500 PSF with 6% air entrainment, per Rain Drop.
2. Minimum Slab Depth: 6-inches of concrete on 8" of clean compacted aggregate base.
3. See Rain Drop drawing 13/13 for concrete slab edge detail and other important information.
4. Minimum Slope: From within splash pad, slope 2-percent (2%) to all drains. For concrete sidewalks at perimeter of splash pad slope 2-percent (2%) away from splash pad.
5. Minimum Slab Reinforcement: #5 reinforcing bars at 12" O.C., each way, bolster supported in the center of the slab.
6. Concrete Finish: A 'light' broomed finish.
7. Saw Cuts: 12' to 15' O.C. in two directions where applicable. Do not intersect water features.
    a. Coordinate locations with provider of active (the water play items) water equipment.
    b. Provide joint filler within all joints.
    c. Fill to level of adjoining surfaces. See detail below.
8. Cold Joints: Joints between colored concrete in splash pad and joints between splash pad and adjacent concrete sidewalks shall be filled with joint filler.
9. Concrete Color: Two integral concrete colors. Plant mixed concrete. See below detail for further information.
    a. Color selection by Owner from manufacture's standard color chart.
    b. Powdered Pigment Colors: Manufacturers: Direct Colors, Cement Colors or approved substitute.
10. Cold Applied Joint Fillers and Primers: Provide for water immersion application.
    a. Joint Primer: Provide W.R. Meadows REZI-WELD LV for wet (submerged) applications. Prime before applying final joint filler per manufacturer's instructions.
    b. Joint Fillers:
        i. Basis of Design: W.R. Meadows Deck-O-Seal HS-1 SL (self-leveling)
        ii. Type: hybrid silyl-modified polymer (SMP).
        iii. Color Options: Gray or Tan.
11. Provide foam backer rods in locations with joints wider than ¼-inch and depths greater than ½-inch.
12. Alternate joint filler types and manufacturers may be substituted during bidding phase with architect approval.



NON-TRAFFIC AREAS

BACKFILL & COMPACTION NOTES

1. The Contractor shall be responsible for all subgrade inspection and soil compaction testing associated with any work. This work shall be completed by or under the supervision of a Professional Geotechnical Engineer licensed in the State of Ohio. For the purposes of these notes and associated approved plans, this Engineer shall be referred to as the Geotechnical Engineer and shall be an independent firm from the Contractor.
2. All inspections, tests, supporting data, reports, and certifications shall be provided to the Owner and shall be sealed by the Geotechnical Engineer. Daily inspection reports, if requested by the Owner, can be provided without being immediately sealed by the Geotechnical Engineer. These reports shall be compiled, reviewed, sealed and then submitted to the Owner at a later date as agreed upon.
3. The Geotechnical Engineer shall approve all fill materials that are used for the project. The Geotechnical Engineer shall obtain samples of proposed fill materials and perform all required testing to determine that fill materials are in conformance with this plan.
4. The Geotechnical Engineer shall provide a report that certifies the subgrade preparation and fill/backfill placement are in conformance with this plan. The certification applies to all fill, backfill, and subgrade operations subject to this plan as detailed in Note #1.
5. All fill and/or backfill material shall be free from organics, frozen material, rocks/stones greater than one and a half inches in any dimension, waste metal products, unsightly debris, toxic material, or other deleterious materials; shall be a minimum of 105 pounds per cubic foot for the maximum dry density according to AASHTO T-180, Method C; and shall not have a liquid limit greater than 30 nor a plasticity index greater than 6 according to ASTM D-4318. All other materials shall meet the requirements stated in Category 900 of the latest edition of the Ohio Department of Transportation (ODOT) Standard Specifications for Construction and Materials.
6. All material shall be compacted to at least 95 percent of the maximum dry density per AASHTO T-180. When necessary, add water or dry the layer in order to compact to the required density. Generally, the material shall be within two percent of the optimum moisture content but may be outside of this range if approved by the Geotechnical Engineer.
7. Fill and backfill materials must completely fill all spaces. At no time during the backfilling operation shall driven equipment be allowed to operate closer than four-feet, measured horizontally, to any part of an existing structure. Under no circumstances shall the Contractor drive equipment over any pipes or other utilities unless there is a compacted fill of 24-inches or greater over the structure or pipe.
8. At a minimum, compaction tests shall be completed for every lift of fill or backfill. The testing frequency shall be at least once per 1,500 square feet of fill. At a minimum, there shall be at least one compaction test per lift and a least two compaction tests per day. The Geotechnical Engineer shall supply the Owner with certified compaction test results, including certification of subgrade and fill subgrade.
9. Prior to placing any fill, the subgrade shall be checked using a DCPT or similar approved method to ensure the subgrade has a bearing capacity of 3,000 psf or higher. The Geotechnical Engineer shall perform one test per 1,500 square feet of area to be filled and determine if the subgrade is acceptable or if there are areas that require remediation. Subgrade areas that fail shall be remediated to the satisfaction of the Geotechnical Engineer by either of the following methods:
   A. Scarifying, moisture conditioning, and re-compaction of the subgrade materials.
   B. Undercutting soft of unsuitable areas of subgrade and backfilling with compacted select borrow.
   C. Undercutting of soft or unsuitable areas of subgrade and placing a layer of geotextile covered by #57 coarse aggregate.

   Owner may approve an alternate approach for soil remediation / improvement if it is recommended and sealed by the Geotechnical Engineer.
10. Except when specified, do not place layers exceeding eight-inches un-compacted depth. Place the material in horizontal layers across the full width of the area to be filled. Perform all rolling in a longitudinal direction along the long axis of the pool and pool house. Begin at the outer edges and progress towards the center. Vary the travel paths of traffic and equipment over the width of the area to aid in obtaining uniform compaction.
11. Uniformly grade areas to a smooth surface, free of irregular surface changes. Grade and prepare the subgrade section to the lines, grades, cross sections and/or elevations shown on the plans. At all times, maintain the subgrade surface in such condition as to readily drain to a sump area, if necessary.
12. Do not place backfill or fill soil material on surfaces that are muddy, frozen, or contain frost or ice. Vehicular and equipment traffic shall be distributed across the prepared surface in such a manner as to prevent disturbance. Repair any damage to the prepared subgrade to the satisfaction of the Geotechnical Engineer.
13. Unsuitable existing fill, soft or loose natural soils, organic material, and rubble shall be stripped to approved grades as determined by the Geotechnical Engineer.
14. Protect all structures and utilities from any damage in the handling, processing or compacting of backfill material. Exercise caution near retaining walls, culverts and utility trenches to prevent undue strain or movement. The Geotechnical Engineer may require the use of specially selected material adjacent to structures to protect against damage. Do not use rock greater than one and a half inches in any dimension adjacent to structures.
15. When placing and compacting fill against the native soil outside of the pool area (existing embankment), continuously bench the slopes. Perform the benching operation as the fill is constructed in layers. Maintain a bench width of at least five-feet. Begin each horizontal cut at the intersection of the original ground and the vertical sides of the previous fill. If the material cut from the benches meets fill requirements, compact this material along with the new fill material.

NOTES:

1. SILT FENCE SHALL BE CONSTRUCTED BEFORE UPSLOPE LAND DISTURBANCE BEGINS.
2. ALL SILT FENCE SHALL BE PLACED AS CLOSE TO THE CONTOUR AS POSSIBLE SO THAT WATER WILL NOT CONCENTRATE AT LOW POINTS IN THE FENCE AND SO THAT SMALL SWALES OR DEPRESSIONS THAT MAY CARRY SMALL CONCENTRATED FLOWS TO THE SILT FENCE ARE DISSIPATED ALONG ITS LENGTH.
